

Robustness Analysis of ECR-Repair

Metric: strict event success (%)

(a) Candidate Pool Size

Only minor degradation as the candidate pool expands.

(b) LLM Backend

Performance remains stable across backends.

(c) Candidate-Identifier Permutation

High performance under per-event permutation rules out a literal ID shortcut.

ECR-Repair remains robust to candidate-pool expansion, backend substitution, and candidate-ID permutation, while a literal CAND002 shortcut fails badly.
